3-ARYLOXY/THIO-3-SUBSTITUTED PROPANAMINES AND THEIR USE IN INHIBITING  
SEROTONIN AND NOREPINEPHRINE REUPTAKE

This invention relates to 3-aryloxy/thio-3-substituted propanamines, and to their use in inhibiting serotonin and norepinephrine reuptake.

5

Serotonin (5HT) has been implicated in the aetiology of many disease states and has been found to be of importance in mental illnesses, depression, anxiety, schizophrenia, eating disorders, obsessive compulsive disorder (OCD) and migraine. Indeed many currently used treatments of these disorders are thought to act by modulating serotonergic tone.

10 During the last decade, multiple serotonin receptor subtypes have been characterised. This has led to the realisation that many treatments act *via* the serotonergic system, such as selective serotonin reuptake inhibitor (SSRI) antidepressants which increase serotonin transmission, such as, for example, the hydrochloride salt of fluoxetine.

15 Drugs that exert their main action on the norepinephrinergic system have been available for some time, however their lack of selectivity made it difficult to determine specific clinical effects produced by a selective action on norepinephrine reuptake. Accumulating evidence indicates that the norepinephrinergic system modulates drive and energy, whereas the serotonergic system modulates mood. Thus norepinephrine appears to play an  
20 important role in the disturbances of vegetative function associated with affective, anxiety and cognitive disorders. Atomoxetine hydrochloride is a selective inhibitor of norepinephrine, and is currently marketed for the treatment of attention deficit hyperactivity disorder (ADHD).

25 Norepinephrine and serotonin receptors are known to interact anatomically and pharmacologically. Compounds that affect only serotonin have been shown to exhibit modulatory effects on norepinephrine, pointing toward an important relationship between the two neurotransmitter systems.

30 Duloxetine, (+)-*N*-methyl-3-(1-naphthalenyloxy)-2-thiophenepropanamine hydrochloride, inhibits the reuptake of both norepinephrine and serotonin, and is currently under

-2-

development for the treatment of depression and urinary incontinence. The compound duloxetine was disclosed in US Patents 5,023,269 and 4,956,388.

US patent number 4,018,895 describes aryloxyphenyl propanamine compounds including  
5 compounds of the formula

Where R is, for example, phenyl, substituted phenyl, tolyl or anisyl. The compounds block the uptake of various physiologically active monoamines including serotonin, norepinephrine and dopamine. Some of the compounds are selective to one of the  
10 monoamines and others have multiple activity. The compounds are indicated as psychotropic agents. Some are also antagonists of apomorphine and/or reserpine.

WO 00/02551 describes *inter alia* 3-aryloxy-3-substituted propanamines which are active at the NMDA receptor and serotonin reuptake site.

15

WO 96/09288 describes indole derivatives which are active at the 5HT receptor. The 5-membered ring portion of the indole moiety is further substituted by one of a number of amine functional groups.

20 WO 01/62714 discloses phenylheteroalkylamine derivatives which are inhibitors of nitric oxide synthase. WO 03/011831 discloses heteroarylheteroalkylamine derivatives which are inhibitors of nitric oxide synthase.

WO 02/094262 discloses heteroaryloxy 3-substituted propanamines as serotonin and  
25 norepinephrine reuptake inhibitors.

The present invention provides novel 3-aryloxy/thio-3-substituted propanamines which are potent inhibitors of both serotonin and norepinephrine reuptake. Preferred compounds of the present invention exhibit (i) greater potency of inhibition of the serotonin and/or

-3-

norepinephrine transporters, and/or (ii) improved selectivity of inhibition of the serotonin and/or norepinephrine transporters relative to the dopamine transporter, and/or (iii) improved ADME properties (e.g. reduced tendency to act as a substrate and/or inhibitor for the enzyme Cytochrome P450 2D6), and/or (iv) improved acid stability, as compared to known inhibitors of both serotonin and norepinephrine reuptake.

According to the present invention there is provided a compound of formula I:

- 10 Compounds of the present invention are inhibitors, preferably selective inhibitors, of the reuptake of both serotonin and norepinephrine and as such are useful as pharmaceuticals. They are particularly useful for the treatment of pain.

- For clinical purposes, pain may be divided into two categories: acute pain and persistent pain. Acute pain is provoked by noxious stimulation produced by injury and/or disease of skin, deep somatic structures or viscera, or abnormal function of muscle or viscera that does not produce actual tissue damage. On the other hand, persistent pain can be defined as pain that persists beyond the usual course of an acute disease or a reasonable time for an injury to heal or that is associated with a chronic pathologic process that causes continuous pain or the pain recurs at intervals for months or years. If pain is still present after a cure should have been achieved, it is considered persistent pain. For the purpose of the present invention, persistent pain can be chronic non-remitting or recurrent. The difference in definition between acute and persistent pain is not merely semantic but has an important clinical relevance. For example, a simple fracture of the wrist usually remains painful for a week to 10 days. If the pain is still present beyond the typical course of treatment, it is likely that the patient is developing reflex sympathetic dystrophy, a persistent pain syndrome that requires immediate effective therapy. Early and effective

-16-

intervention potentially prevents the undue disability and suffering, and avoids the potential development of a condition that becomes refractory to therapy.

Acute and chronic pain differ in etiology, mechanisms, pathophysiology,  
5     symptomatology, diagnosis, therapy, and physiological responses. In contrast to the  
transitory nature of acute pain, persistent pain is caused by chronic pathologic processes  
in somatic structures or viscera, by prolonged and sometimes permanent dysfunction of  
the peripheral or central nervous system, or both. Also, persistent pain can sometimes be  
attributed to psychologic mechanisms and/or environmental factors.

10

Current therapies for persistent pain include opiates, barbiturate-like drugs such as  
thiopental sodium and surgical procedures such as neurectomy, rhizotomy, cordotomy,  
and cordectomy.

15     The compounds of the present invention are indicated in the treatment of persistent pain  
and references herein to pain are intended to refer to persistent pain.

In addition to the compounds of formula I and processes for the preparation of said  
compounds, the present invention further provides pharmaceutical compositions  
20     comprising a compound of formula I or a pharmaceutically acceptable salt thereof,  
together with a pharmaceutically acceptable diluent or carrier.

Further, the present invention provides a compound of formula I or a pharmaceutically  
acceptable salt thereof, for use as a pharmaceutical; and a compound of formula I or a  
25     pharmaceutically acceptable salt thereof, for use as a selective inhibitor of the reuptake of  
both serotonin and norepinephrine.

The present compounds and salts may be indicated in the treatment of disorders  
associated with serotonin and norepinephrine dysfunction in mammals.

30

The term "serotonin and norepinephrine dysfunction" as used herein refers to a reduction  
in the amount of serotonin and norepinephrine neurotransmitters within the synaptic cleft

-17-

below that which would be considered to be normal or desirable for a species, or an individual within that species. Thus the phrase "disorders associated with serotonin and norepinephrine dysfunction in mammals" refers to disorders which are associated with a reduction in the amount of serotonin and norepinephrine neurotransmitters within the synaptic cleft below that which would be considered to be normal or desirable for the mammalian species, or an individual within the species, in question. Some examples of disorders currently believed to be associated with reduced levels of serotonin and norepinephrine within the synaptic cleft include depression, OCD, anxiety, memory loss, urinary incontinence (including stress urinary incontinence and urge incontinence), conduct disorders, attention-deficit disorder (including ADHD), obesity, hot flushes/flushes, pain (including inflammatory pain, neuropathic pain, non-neuropathic non-inflammatory pain, persistent pain, persistent pain of inflammatory and/or neuropathic origin, headache and migraine), eating disorders (including bulimia and anorexia nervosa), inflammatory bowel disorders, functional bowel disorders, dyspepsia, chron's disease, ileitis, ischemic bowel disease, ulcerative colitis, gastroesophageal reflux for functional bowel disorders, irritable bowel syndrome, interstitial cystitis, urethral syndrome, gastric motility disorders, substance abuse (including alcoholism, tobacco abuse, smoking cessation, symptoms caused by withdrawal or partial withdrawal from the use of tobacco or nicotine and drug addiction including cocaine abuse), dementia of ageing, senile dementia, Alzheimer's, Parkinsonism, social phobia, disruptive behavior disorders, impulsive control disorders, borderline personality disorder, chronic fatigue syndrome, panic disorders, post-traumatic stress disorder, schizophrenia, gastrointestinal disorders, cardiovascular disorders, emesis, sleep disorders, cognitive disorders, psychotic disorders, brain trauma, premenstrual syndrome or late luteal syndrome, sexual dysfunction (including premature ejaculation and erectile difficulty), autism, mutism and trichotilomania. The compounds of the present invention are particularly suitable for the treatment of pain.

The compounds of the present invention are also indicated for the treatment of disorders which are ameliorated by an increase in the amount of serotonin and norepinephrine neurotransmitters within the synaptic cleft of a mammal above that which would be

-18-

considered to be normal or desirable for the mammalian species, or an individual within the species, in question.

The term "treatment" as used herein refers to both curative and prophylactic treatment of disorders associated with norepinephrine dysfunction.

The present invention also provides the use of a compound of formula I, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for selectively inhibiting the reuptake of serotonin and norepinephrine; the use of a compound of formula I, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of disorders associated with serotonin and norepinephrine dysfunction in mammals; the use of a compound of formula I, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of a disorder selected from those listed above and in particular selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation, hot flushes/flushes and pain; and the use of a compound of formula I, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of a disorder selected from depression, urinary incontinence, particularly stress induced urinary incontinence, and more especially, pain.

The present invention further provides a compound of formula I for treating disorders associated with serotonin and norepinephrine dysfunction in mammals, for example a disorder selected from those listed above and in particular selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation, hot flushes/flushes and pain, especially depression, urinary incontinence, particularly stress induced urinary incontinence, and, more especially, pain.

Further the present invention provides a method for selectively inhibiting the reuptake of serotonin and norepinephrine in mammals, comprising administering to a patient in need thereof an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof; a method for treating disorders associated with serotonin and norepinephrine dysfunction in mammals, comprising administering to a patient in need thereof an

-19-

effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof; and a method for treating a disorder selected from those listed above and in particular selected from depression, OCD, anxiety, memory loss, urinary incontinence, conduct disorders, ADHD, obesity, alcoholism, smoking cessation, hot flushes/flushes and pain, comprising administering to a patient in need thereof an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof.

The present invention includes the pharmaceutically acceptable salts of the compounds of formula I. Suitable salts include acid addition salts, including salts formed with inorganic acids, for example hydrochloric, hydrobromic, nitric, sulphuric or phosphoric acids, or with organic acids, such as organic carboxylic acids, for example pyruvic, lactobionic, glycolic, oxalic, maleic, hydroxymaleic, fumaric, malic, tartaric, citric, salicylic, *o*-acetoxybenzoic, or organic sulphonic, 2-hydroxyethane sulphonic, toluene-*p*-sulphonic, bisethanesulphonic acid or methanesulphonic acid.

In addition to the pharmaceutically acceptable salts, other salts are included in the invention. They may serve as intermediates in the purification of compounds or in the preparation of other, for example pharmaceutically acceptable, acid addition salts, or are useful for identification, characterisation or purification.

While all the compounds of the present invention are believed to inhibit the reuptake of serotonin and norepinephrine in mammals there are certain of these compounds which are preferred for such uses. Preferred values for A, X, Y, Z, R<sub>1</sub> and R<sub>2</sub> and substituents for each have been set out above.

Compounds of the present invention may be prepared by conventional organic chemistry techniques as described below.

When Z is H, 1-X-3-aminopropanols can be prepared via the corresponding 3-amino-*N*-methoxy-*N*-methylpropanamide, known as a Weinreb amide, as follows:

-20-

- Subjecting a Weinreb amide of *N*-methyl  $\beta$ -alanine appropriately protected at the nitrogen, for example as a *t*-butyl carbamate (Boc) or as a benzyl amine, to an
- 5 organometallic reagent like an alkyl Grignard or alkyl lithium results in the desired X-substituted ketone. The ketone can be readily reduced to the desired racemic alcohol using standard reducing agents such as sodium borohydride in a protic solvent such as lower order alkyl alcohols.
- 10 The Weinreb amides of this invention may be prepared by conventional organic chemistry techniques as exemplified below:

- 15 Subjecting a commercially available appropriately *N*-protected  $\beta$ -alanine to sodium hydride followed by methyl iodide results in the *N*-methylated derivative, which then can be converted to the Weinreb amide by reaction with *N*-methyl-*O*-methylhydroxylamine. The Weinreb amides can also be prepared by reacting a 3-bromopropanoyl chloride with *N*-methyl-*O*-methylhydroxylamine to give the Weinreb amide of 3-bromopropanoic acid,
- 20 which then can be substituted with an appropriately substituted amine to give the desired Weinreb amide.

- When Z is H, another preferred route to 1-X-3-aminopropanols is addition of a suitable organometallic reagent to an appropriately *N*-protected aminoaldehyde. Thus an
- 25 appropriately protected amine can be added to a vinyl aldehyde in a Michael addition

-21-

reaction to give a 3-aminopropanal. This aminoaldehyde can be subjected to (for example) an alkyl Grignard reagent or an alkyl lithium reagent to give the desired 1-alkylpropanol. Selection of other Grignard reagents or organolithium reagents could provide other 1-X-3-aminopropanols.

5

The benzothiophenes of the invention have been made by several routes. Thus a preferred route is by the alkylation of a thiophenol derivative with bromoacetaldehyde diethyl acetal followed by subsequent acid catalysed cyclisation with polyphosphoric acid in chlorobenzene with elimination of ethanol. Subsequent demethylation provided the hydroxybenzothiophene needed for subsequent ether formation.

10

15

Analogous cyclisation of phenylthioacetone derivatives with PPA can be used to synthesise 3-methyl derivatives of benzothiophene methyl ethers.

A further preferred route to substituted benzothiophenes is an iodine catalysed cyclisation of a mercaptopropenoic acid. Thus a benzaldehyde can be condensed with rhodanine and subsequently hydrolysed under basic conditions to a mercaptopropenoic acid. The resultant mercaptopropenoic acid can be cyclised using iodine and then decarboxylated with diazobicycloundecane in dimethylacetamide. Finally boron tribromide in dichloromethane may be used to demethylate the methyl ether to provide the hydroxybenzothiophene.

25

-22-

Methods for the synthesis of other Y-OH precursors of use in the present invention (or literature references describing their synthesis) are provided in the experimental section below.

The corresponding ethers and thioethers can generally be prepared as follows:

10

The propanols can be subjected to *O*-arylation or *S*-arylation reactions. Various *O*-arylation conditions can be used such as the Mitsunobu reaction, wherein roughly equal quantities of the heteroaryl alcohol and the 1-X,3-aminopropanol are stirred at temperatures of between 0 °C and reflux in a polar non protic solvent such as toluene, with a complexing agent such as 1,1'(azodicarbonyl)dipiperidine, or another derivative, and a phosphine ligand such as tributylphosphine. This type of reaction is well known and further combinations of the Mitsunobu reagents can be found in Organic Preparations and Procedures Int., 1996, 28, 2, 165 and references therein. For converting hydroxy to aryl sulfide it is preferred to react the propanol species with Y-SH, (cyanomethyl)trimethylphosphonium iodide (Tetrahedron, 2001, 57, 5451-5454) and diisopropylamine in propionitrile.

20

-23-

- The corresponding protected amines can be readily converted to the corresponding amines by standard methods. For example, trifluoroacetic acid can be used for deprotection of a
- 5 *N*-*t*-butoxycarbonyl group and 1-chloroethyl chloroformate in dichloroethane followed by methanol can be used to remove the benzyl group. Finally, resolution of the obtained racemates can be obtained by chiral chromatography.

-24-

Alternatively, the "syn" chain hydroxylated propanamines may be prepared using the method outlined below.

5

Alternatively, the "syn" and "anti" chain hydroxylated propanamines may be prepared using the intermediates shown below.

-25-

The same chemical transformations may be applied to each intermediate to obtain each of the four stereochemically distinct final products. For example:

5

Starting from the other three intermediates, the same chemistry may be used to obtain the other three final products, i.e.

10

The four intermediates may be synthesized by two different routes. The first route is shown below:

15

Separation of  
diastereoisomers

The other two intermediates may be obtained using the same chemistry but starting with the compound:

-26-

The second route is shown below:

The other two intermediates may be obtained using the same chemistry but starting with the compound:

The preparation of the reagent 4,4-(dimethyl-1,1-dioxido-1,2,5-thiadiazolidin-2-yl)-triphenyl phosphonium is described in J. Org. Chem. 1994, 59, 2289. Note however that for converting hydroxy to aryl sulfide it is preferred to react the propanol species with Y-SH, (cyanomethyl)trimethylphosphonium iodide (Tetrahedron, 2001, 57, 5451-5454) and diisopropylamine in propionitrile.

10

The "syn" chain fluorinated propanamines may be prepared using the method outlined below.

15

-27-

The "anti" chain fluorinated propanamines may be prepared using the method outlined below.

The compounds of the present invention may be used as medicaments in human or veterinary medicine. The compounds may be administered by various routes, for example, by oral or rectal routes, topically or parenterally, for example by injection, and are usually employed in the form of a pharmaceutical composition.

15

Such compositions may be prepared by methods well known in the pharmaceutical art and normally comprise at least one active compound in association with a pharmaceutically acceptable diluent or carrier. In making the compositions of the present invention, the active ingredient will usually be mixed with a carrier or diluted by a carrier, and/or enclosed within a carrier which may, for example, be in the form of a capsule, sachet, paper or other container. Where the carrier serves as a diluent, it may be solid, semi-solid, or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the composition may be in the form of tablets, lozenges, sachets, cachets, elixirs, suspensions, solutions, syrups, aerosol (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, injection solutions and suspensions and sterile packaged powders.

30

Some examples of suitable carriers are lactose, dextrose, vegetable oils, benzyl alcohols, alkylene glycols, polyethylene glycols, glycerol triacetate, gelatin, carbohydrates such as starch and petroleum jelly, sucrose sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, syrup, methyl cellulose, methyl- and propyl-

hydrobenzoate, talc, magnesium stearate and mineral oil. The compounds of formula (I) can also be lyophilized and the lyophilizates obtained used, for example, for the production of injection preparations. The preparations indicated can be sterilized and/or can contain auxiliaries such as lubricants, preservatives, stabilizers and/or wetting agents, emulsifiers, salts for affecting the osmotic pressure, buffer substances, colourants, flavourings and/or one or more further active compounds, e.g. one or more vitamins. Compositions of the invention may be formulated so as to provide, quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures well known in the art.

10

The compositions are preferably formulated in a unit dosage form, each dosage containing from about 5 to about 500 mg, more usually about 25 to about 300 mg, of the active ingredient. The term "unit dosage form" refers to physically discrete units suitable as unitary doses for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical carrier.

15

The pharmacological profile of the present compounds may be demonstrated as follows. All of the exemplified compounds above have been found to exhibit  $K_i$  values less than  $1\mu\text{M}$  at the serotonin and norepinephrine transporters as determined using the scintillation proximity assays described below. Furthermore, all of the exemplified compounds above have been found to exhibit a  $K_i$  value less than  $100\text{nM}$  at the serotonin transporter and/or a  $K_i$  value less than  $100\text{nM}$  at the norepinephrine transporter as determined using the scintillation proximity assays described below. Preferred compounds of the present invention are those which exhibit a  $K_i$  value less than  $100\text{nM}$  (preferably less than  $50\text{nM}$ ) at the serotonin transporter and a  $K_i$  value less than  $100\text{nM}$  (preferably less than  $50\text{nM}$ ) at the norepinephrine transporter as determined using the scintillation proximity assays described below. Furthermore, all of the exemplified compounds above have been found to selectively inhibit the serotonin and norepinephrine transporters relative to the dopamine transporter. Preferred compounds of the present invention selectively inhibit the serotonin and norepinephrine transporters relative to the dopamine transporter by a factor of at least five using the scintillation proximity assays as described below.

Generation of stable cell-lines expressing the human dopamine, norepinephrine and serotonin transporters

Standard molecular cloning techniques were used to generate stable cell-lines expressing the human dopamine, norepinephrine and serotonin transporters. The polymerase chain reaction (PCR) was used in order to isolate and amplify each of the three full-length cDNAs from an appropriate cDNA library. Primers for PCR were designed using the following published sequence data:

The PCR products were cloned into a mammalian expression vector (eg pcDNA3.1 (Invitrogen)) using standard ligation techniques. The constructs were then used to stably transfect HEK293 cells using a commercially available lipofection reagent (Lipofectamine<sup>TM</sup> - Invitrogen) following the manufacture's protocol.

The homogenate was centrifuged twice (40,000g, 10min, 4°C) with pellet re-suspension in 4 volumes of Tris-HCl buffer containing the above reagents after the first spin and 8 volumes after the second spin. #### Formalin Paw Assay

25 

The analgesic effect of compounds of the invention for the treatment of persistent nociceptive pain was demonstrated using the well-known "formalin test." The formalin test is a model of persistent nociceptive activation induced by tissue injury which can lead to central sensitization. (Shibata, M., Ohkubo, T., Takahashi, H., and Inoki, R., "Modified formalin test: Characteristic biphasic pain response," *Pain* (1989) 38: 347-352;

30 

and Tjolsen, A., Berge, O.G., Hunskaar, S., Rosland, J.H., and Hole, K., "The formalin test: an evaluation of the method," *Pain* (1992) 51:5-17.) The effect of compounds of the invention on formalin-induced paw-licking behavior in the rat was investigated as an

-91-

index of persistent nociceptive activation. In this test, the injection of formalin under the skin on the dorsal lateral surface of the hind paw of rats causes an immediate and intense increase in the spontaneous activity of C fiber afferents. This activation evokes a distinctly quantifiable behavior indicative of pain, such as licking of the injected paw.

- 5 The behavioral response to formalin is biphasic, with an early phase that is short lived, followed by an extended tonic response or late phase of persistent nociceptive activation. Mechanisms causing the late phase response, such as central sensitization of pain transmitting neurons, are currently believed to contribute to various types of persistent pains.

10

Male Sprague-Dawley rats (200-250g; Charles River, Portage, MI) were maintained at constant temperature and light (12h light/12h dark) for 4-7 days prior to the studies. Animals had free access to food and water at all times prior to the day of the experiment.

- 15 Scoring in the formalin test was performed according to Coderre *et al.*, 1993b and Abbott *et al.*, 1995. (Coderre T.J., Fundytus M.E., McKenna J.E., Dalal S. and Melzack R. "The formalin test: a validation of the weighted-scores method of the behavioral pain rating," *Pain*(1993b) 54: 43-50; and Abbott F.V., Franklin K.B.J. and Westbrook R.F. "The formalin test: scoring properties of the first and second phases of the pain response in rats," *Pain* (1995) 60: 91-102.) The sum of time spent licking in seconds from time 0 to 20 5 minutes was considered the early phase while the late phase was taken as the sum of seconds spent licking from 15 to 40 minutes.

- Data are presented as means with standard errors of means ( $\pm$  SEM). Data were evaluated 25 by one-way analysis of variance (ANOVA) and the appropriate contrasts analyzed by Tukey's test and Dunnett "t" test for two-sided comparisons.

- The preferred compounds of the present invention show good stability to the action of the CYP 2D6 enzyme. This is advantageous because it is likely to lead to improved 30 metabolic stability of the compounds.

-92-

Stability to the CYP 2D6 enzyme may be determined according to the assay described below:

In Vitro Determination of the Interaction of compounds with CYP2D6 in Human Hepatic

5 Microsomes

Cytochrome P450 2D6 (CYP2D6) is a mammalian enzyme which is commonly associated with the metabolism of around 30% of pharmaceutical compounds. Moreover, this enzyme shows a genetic polymorphism with as a consequence a presence in the population of poor and normal metabolizers. A low involvement of CYP2D6 in the metabolism of compounds (i.e. the compound being a poor substrate of CYP2D6) is desirable in order to reduce any variability from subject to subject in the pharmacokinetics of the compound. Also, compounds with a low inhibitor potential for CYP2D6 are desirable in order to avoid drug-drug interactions with co-administered drugs that are substrates of CYP2D6. Compounds may be tested both as substrates and as inhibitors of this enzyme by means of the following assays.

CYP2D6 substrate assay

**Principle:**

This assay determines the extent of the CYP2D6 enzyme involvement in the total oxidative metabolism of a compound in microsomes. Preferred compounds of the present invention exhibit less than 75% total metabolism via the CYP2D6 pathway.

For this in vitro assay, the extent of oxidative metabolism in human liver microsomes (HLM) is determined after a 30 minute incubation in the absence and presence of Quinidine, a specific chemical inhibitor of CYP2D6. The difference in the extent of metabolism in absence and presence of the inhibitor indicates the involvement of CYP2D6 in the metabolism of the compound.

**Materials and Methods:**

Human liver microsomes (mixture of 20 different donors, mixed gender) were acquired from Human Biologics (Scottsdale, AZ, USA). Quinidine and  $\beta$ -NADPH ( $\beta$ -Nicotinamide Adenine Dinucleotide Phosphate, reduced form, tetrasodium salt) were purchased from Sigma (St Louis, MO, USA). All the other reagents and solvents were of

analytical grade. A stock solution of the new chemical entity (NCE) was prepared in a mixture of Acetonitrile/Water to reach a final concentration of acetonitrile in the incubation below 0.5%.

The microsomal incubation mixture (total volume 0.1 mL) contained the NCE (4  
5  $\mu\text{M}$ ),  $\beta$ -NADPH (1 mM), microsomal proteins (0.5 mg/mL), and Quinidine (0 or 2  $\mu\text{M}$ ) in 100 mM sodium phosphate buffer pH 7.4. The mixture was incubated for 30 minutes at 37 °C in a shaking waterbath. The reaction was terminated by the addition of acetonitrile (75  $\mu\text{L}$ ). The samples were vortexed and the denaturated proteins were removed by centrifugation. The amount of NCE in the supernatant was analyzed by liquid  
10 chromatography /mass spectrometry (LC/MS) after addition of an internal standard. A sample was also taken at the start of the incubation (t=0), and analysed similarly.

Analysis of the NCE was performed by liquid chromatography /mass spectrometry. Ten  $\mu\text{L}$  of diluted samples (20 fold dilution in the mobile phase) were injected onto a Spherisorb CN Column, 5  $\mu\text{M}$  and 2.1 mm x 100 mm (Waters corp.  
15 Milford, MA, USA). The mobile phase consisting of a mixture of Solvent A/Solvent B, 30/70 (v/v) was pumped (Alliance 2795, Waters corp. Milford, MA, USA) through the column at a flow rate of 0.2 ml/minute. Solvent A and Solvent B were a mixture of ammonium formate  $5 \cdot 10^{-3}$  M pH 4.5/ methanol in the proportions 95/5 (v/v) and 10/90 (v/v), for solvent A and solvent B, respectively. The NCE and the internal standard were  
20 quantified by monitoring their molecular ion using a mass spectrometer ZMD or ZQ (Waters-Micromass corp, Machester, UK) operated in a positive electrospray ionisation.

The extent of CYP2D6 involvement (% of CYP2D6 involvement) was calculated comparing the extent of metabolism in absence and in presence of quinidine in the incubation.

25 The extent of metabolism without inhibitor (%) was calculated as follows:

$$\frac{(\text{NCE response in samples without inhibitor})_{\text{time 0}} - (\text{NCE response in samples without inhibitor})_{\text{time 30}}}{(\text{NCE response in samples without inhibitor})_{\text{time 0}}} \times 100$$

The extent of metabolism with inhibitor (%) was calculated as follows:

$$\frac{(\text{NCE response in samples without inhibitor})_{\text{time 0}} - (\text{NCE response in samples with inhibitor})_{\text{time 30}}}{(\text{NCE response in samples without inhibitor})_{\text{time 0}}} \times 100$$

where the NCE response is the area of the NCE divided by the area of the internal  
30 standard in the LC/MS analysis chromatogram, time0 and time30 correspond to the 0 and 30 minutes incubation time.

- 94 -

The % of CYP2D6 involvement was calculated as follows:

$$\frac{(\% \text{ extent of metabolism without inhibitor}) - (\% \text{ extent of metabolism with inhibitor})}{\% \text{ extent of metabolism without inhibitor}} \times 100$$

#### CYP2D6 inhibitor assay

##### 5 Principle:

The CYP2D6 inhibitor assay evaluates the potential for a compound to inhibit CYP2D6. This is performed by the measurement of the inhibition of the bufuralol 1'-hydroxylase activity by the compound compared to a control. The 1'-hydroxylation of bufuralol is a metabolic reaction specific to CYP2D6. Preferred compounds of the present  
10 invention exhibit an IC<sub>50</sub> higher than 6 μM for CYP2D6 activity, the IC<sub>50</sub> being the concentration of the compound that gives 50 % of inhibition of the CYP2D6 activity.

##### Material and methods:

Human liver microsomes (mixture of 20 different donors, mixed gender) were  
15 acquired from Human Biologics (Scottsdale, AZ). β-NADPH was purchased from Sigma (St Louis, MO). Bufuralol was purchased from Ultrafine (Manchester, UK). All the other reagents and solvents were of analytical grade.

Microsomal incubation mixture (total volume 0.1 mL) contained bufuralol 10 μM, β-NADPH (2 mM), microsomal proteins (0.5 mg/mL), and the new chemical entity  
20 (NCE) (0, 5, and 25 μM) in 100 mM sodium phosphate buffer pH 7.4. The mixture was incubated in a shaking waterbath at 37 °C for 5 minutes. The reaction was terminated by the addition of methanol (75 μL). The samples were vortexed and the denaturated proteins were removed by centrifugation. The supernatant was analyzed by liquid chromatography connected to a fluorescence detector. The formation of the 1'-hydroxybufuralol was  
25 monitored in control samples (0 μM NCE) and in the samples incubated in presence of the NCE. The stock solution of NCE was prepared in a mixture of Acetonitrile/Water to reach a final concentration of acetonitrile in the incubation below 1.0%.

The determination of 1'-hydroxybufuralol in the samples was performed by liquid chromatography with fluorimetric detection as described below. Twenty five μL samples  
30 were injected onto a Chromolith Performance RP-18e column (100 mm x 4.6 mm) (Merck KGaA, Darmstadt, Germany). The mobile phase, consisting of a mixture of

solvent A and solvent B whose the proportions changed according the following linear gradient, was pumped through the column at a flow rate of 1 ml/min:

Time (minutes)	Solvent A (%)	Solvent B (%)
0	65	35
2.0	65	35
2.5	0	100
5.5	0	100
6.0	65	35

5 Solvent A and Solvent B consisted of a mixture of 0.02 M potassium dihydrogenophosphate buffer pH3/ methanol in the proportion 90/10 (v/v) for solvent A and 10/90 (v/v) for solvent B. The run time was 7.5 minutes. Formation of 1'-hydroxybufuralol was monitored by fluorimetric detection with extinction at  $\lambda$  252 nm and emission at  $\lambda$  302 nm.

10 The  $IC_{50}$  of the NCE for CYP2D6 was calculated by the measurement of the percent of inhibition of the formation of the 1'-hydroxybufuralol in presence of the NCE compared to control samples (no NCE) at a known concentration of the NCE.

The percent of inhibition of the formation of the 1'-hydroxybufuralol is calculated as follows:

$$15 \quad \frac{(1'\text{-hydroxybufuralol formed without inhibitor}) - (1'\text{-hydroxybufuralol formed with inhibitor})}{(1'\text{-hydroxybufuralol area formed without inhibitor})} \times 100$$

The  $IC_{50}$  is calculated from the percent inhibition of the formation of the 1'-hydroxybufuralol as follows (assuming competitive inhibition):

$$\frac{NCE \text{ Concentration} \times (100 - \text{Percent of inhibition})}{\text{Percent of inhibition}}$$

20 The  $IC_{50}$  estimation is assumed valid if inhibition is between 20% and 80% (Moody GC, Griffin SJ, Mather AN, McGinnity DF, Riley RJ. 1999. Fully automated analysis of activities catalyzed by the major human liver cytochrome P450 (CYP) enzymes: assessment of human CYP inhibition potential. *Xenobiotica*, 29(1): 53-75).

Continuation of Box I.1

Although claims 49-52 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

Continuation of Box I.2

Claims Nos.: 1-15 (in part), 18-25, 32-38 and 39-52 (in part)

Present claims 1-52 relate to an extremely large number of possible compounds/compositions/methods. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds/compositions/methods claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds/compositions/methods supported by examples, e.g. compounds in which Y=unsubstituted or substituted phenyl or benzothienyl.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 49-52 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1-15 (in part), 18-25, 32-38 and 39-52 (in part)  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
